INTRODUCTION TO HUMAN ANATOMY

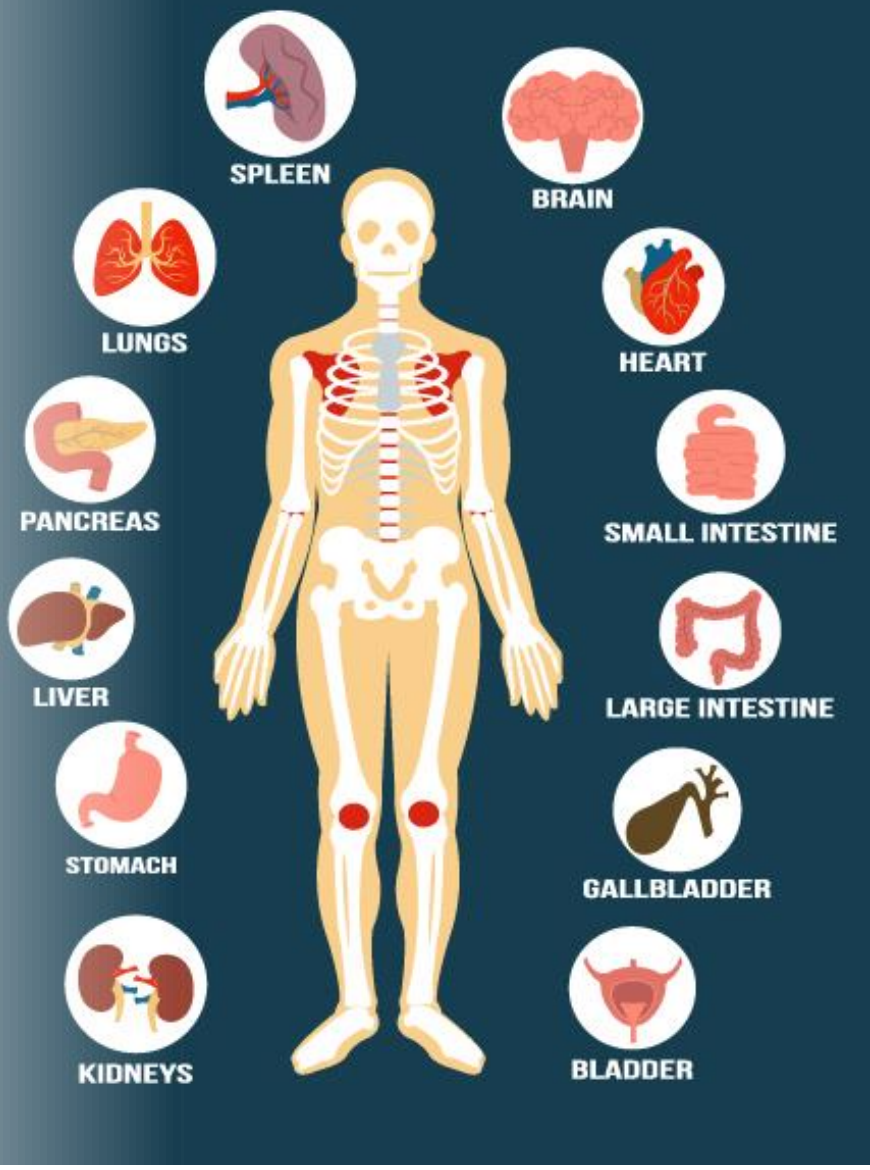

BY

PROF.DR. ABEER EL-SAID EL-MEHI

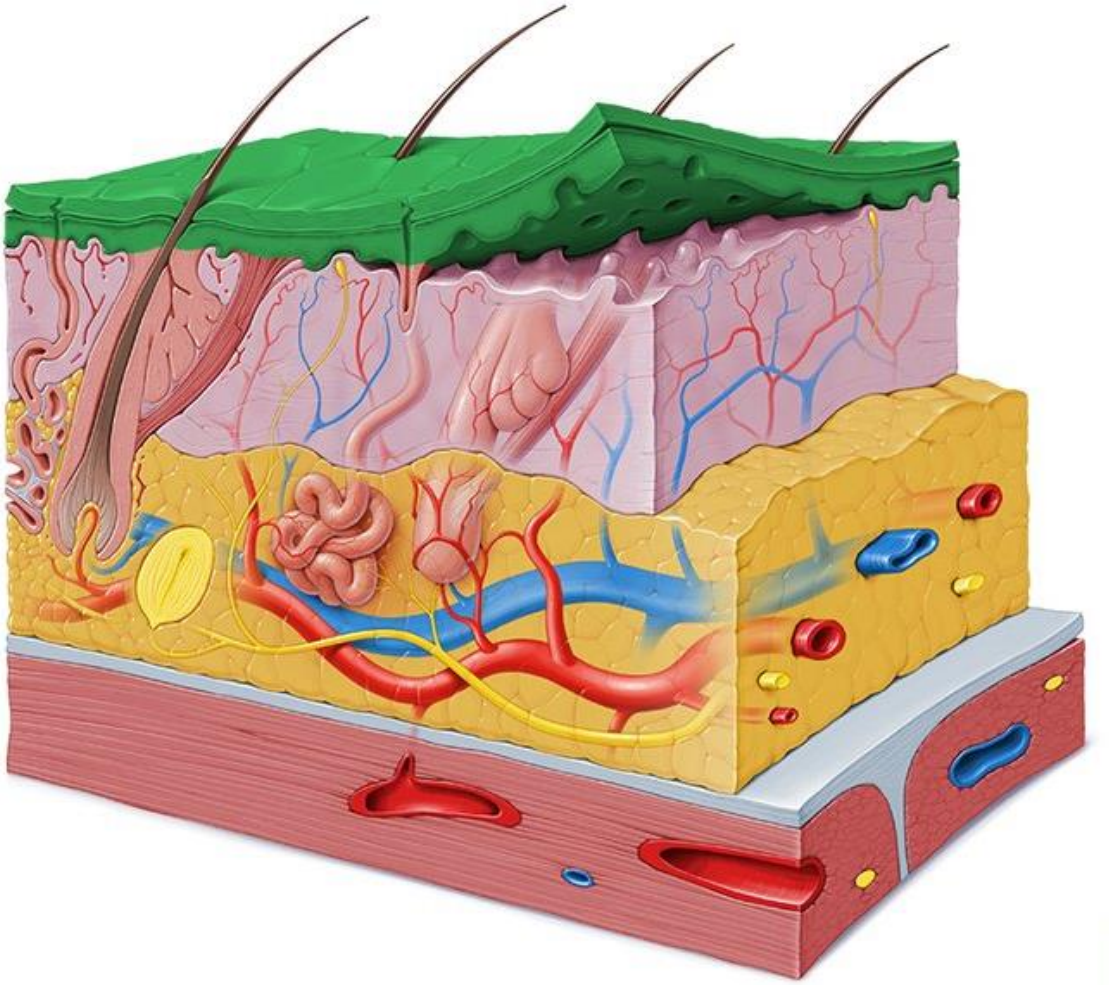

PROFESSOR OF ANATOMY AND EMBRYOLOGY

FACULTY OF MEDICINE

MENOUFIA UNIVERSITY

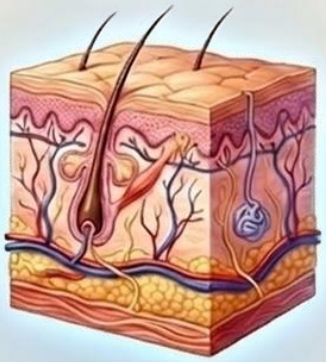

INTEGUMENTARY SYSTEM

Integumentary system

Skin

Skin appendages

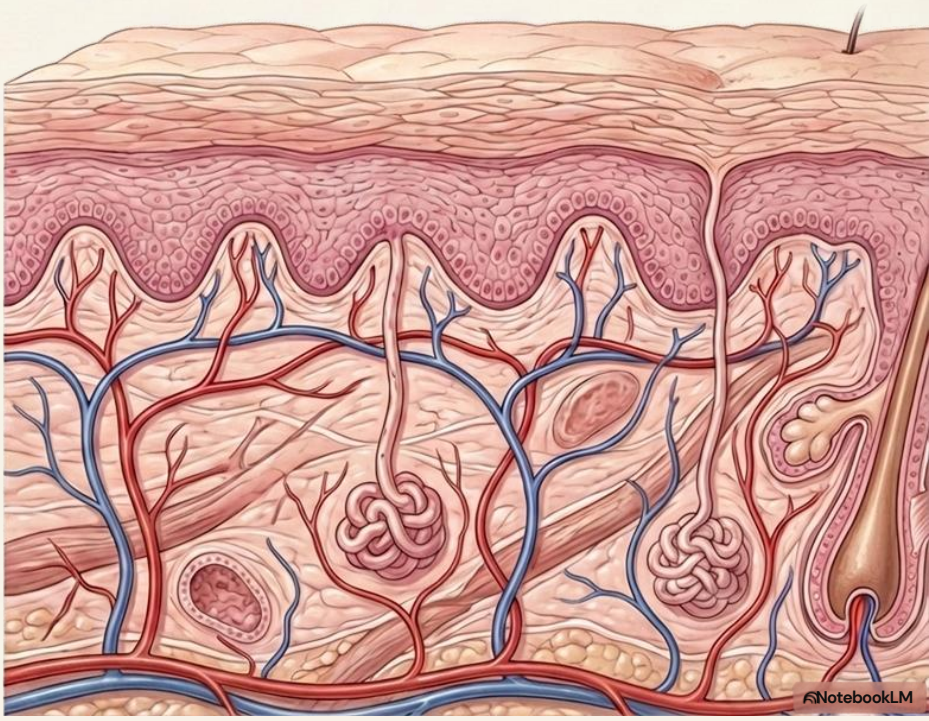

Skin Layers

EPIDERMIS

- The superficial layer.
- Thinner.
- Avascular.

DERMIS

- The deep layer.
- Thicker.
- Vascular.

Skin Appendages

Hair & Sebaceous Glands

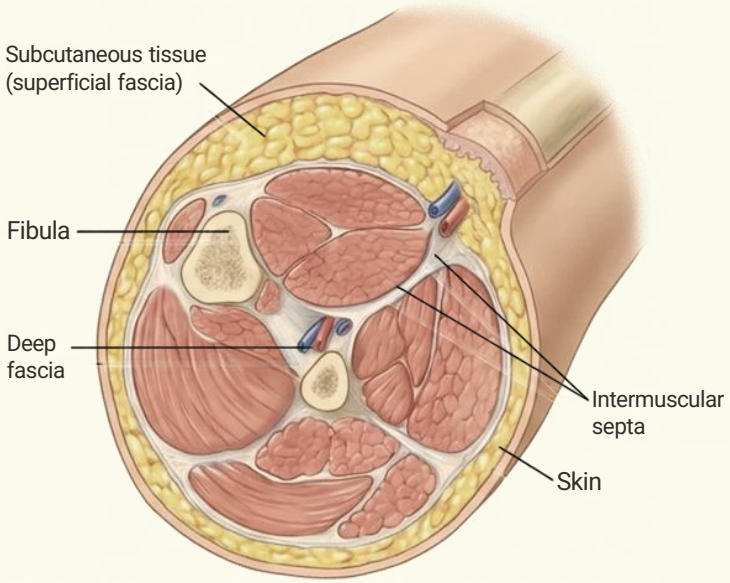

Sweat Glands (Thermoregulation)

Nails

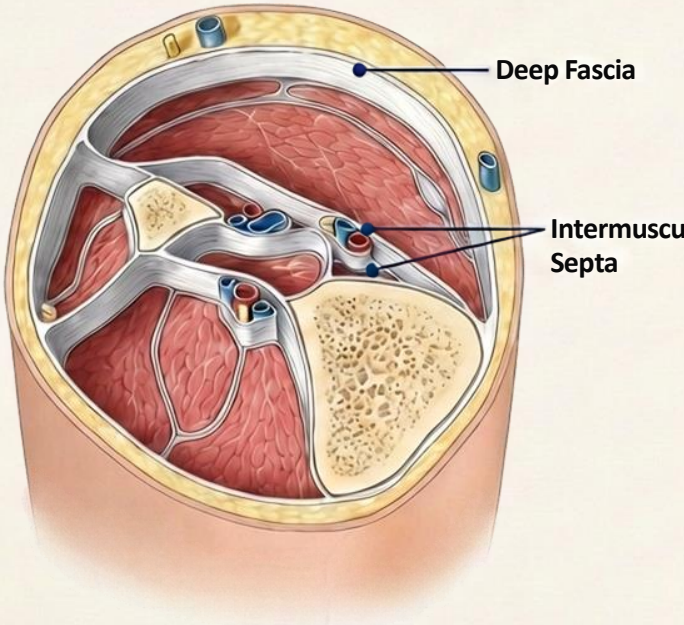

The superficial fascia

- **Also known as: Hypodermis or Subcutaneous Tissue.**
- **Location: Lies immediately deep to and is attached to the dermis.**
- **Contains a variable amount of fat.**

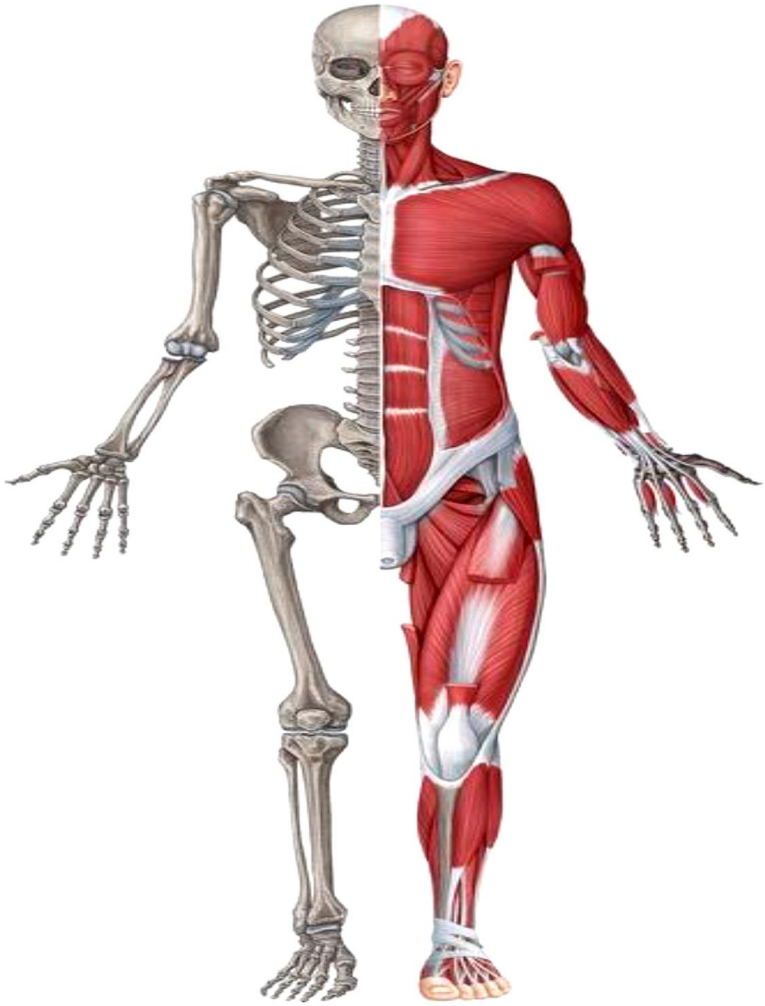

Deep Fascia

- A tough dense fibrous membrane deep to the superficial fascia.
- Thickened in palm and sole for protection of underlying structures.
- It is absent in the face & anterior abdominal wall.

MUSCULAR SYSTEM

Types of muscles

Skeletal

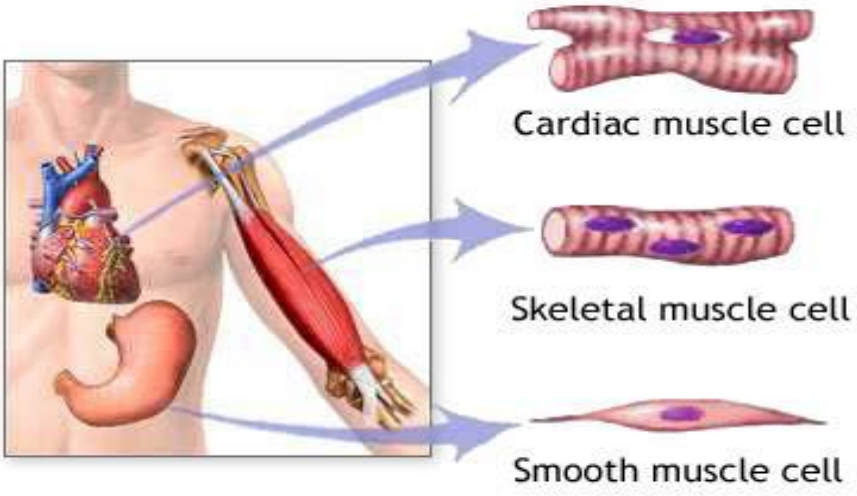

- ✓ Mostly attached to the skeleton.
- ✓ Acts voluntarily.
- ✓ Supplied by somatic nerves.

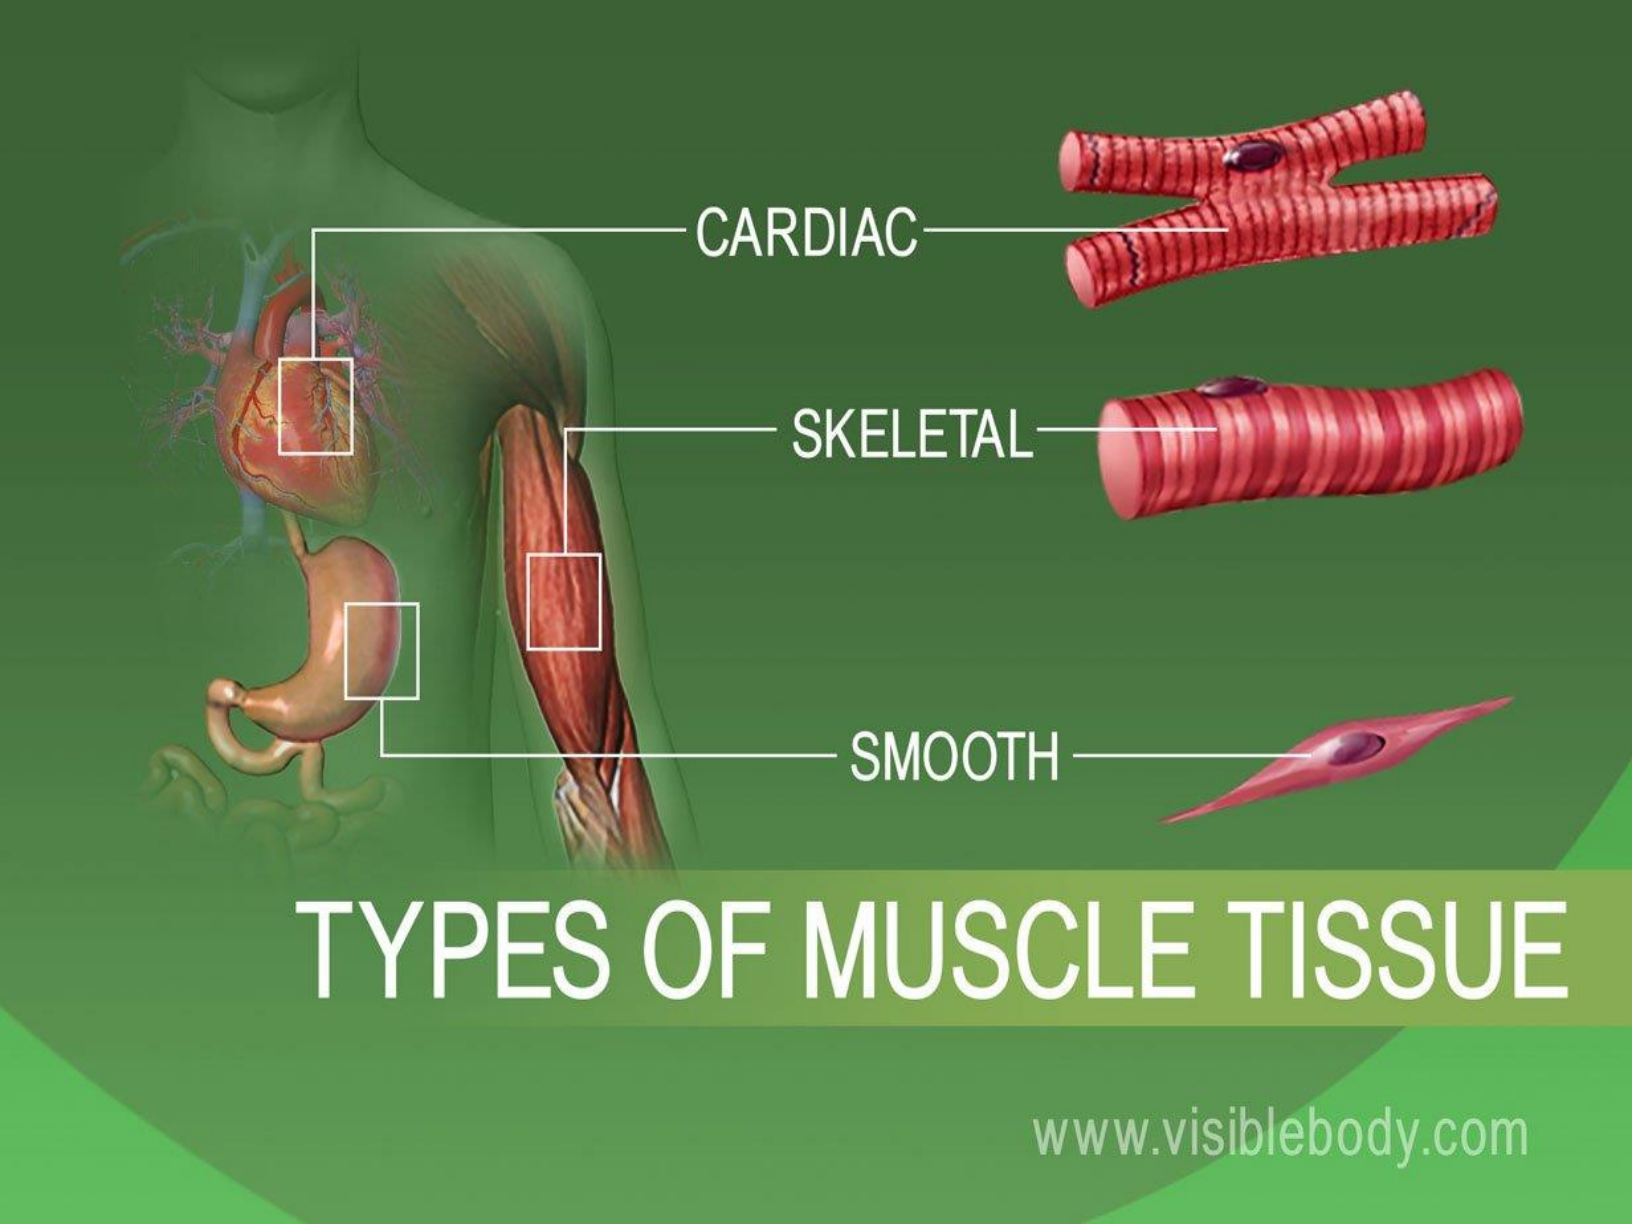

Cardiac

- ✓ In the wall of the heart (myocardium).
- ✓ Acts involuntarily.
- ✓ Supplied by autonomic nerves.

Smooth

- ➢ In the walls of blood vessels and hollow organs (viscera).
- ➢ Acts involuntarily.
- ➢ Supplied by autonomic nerves.

TYPES OF MUSCLE TISSUE

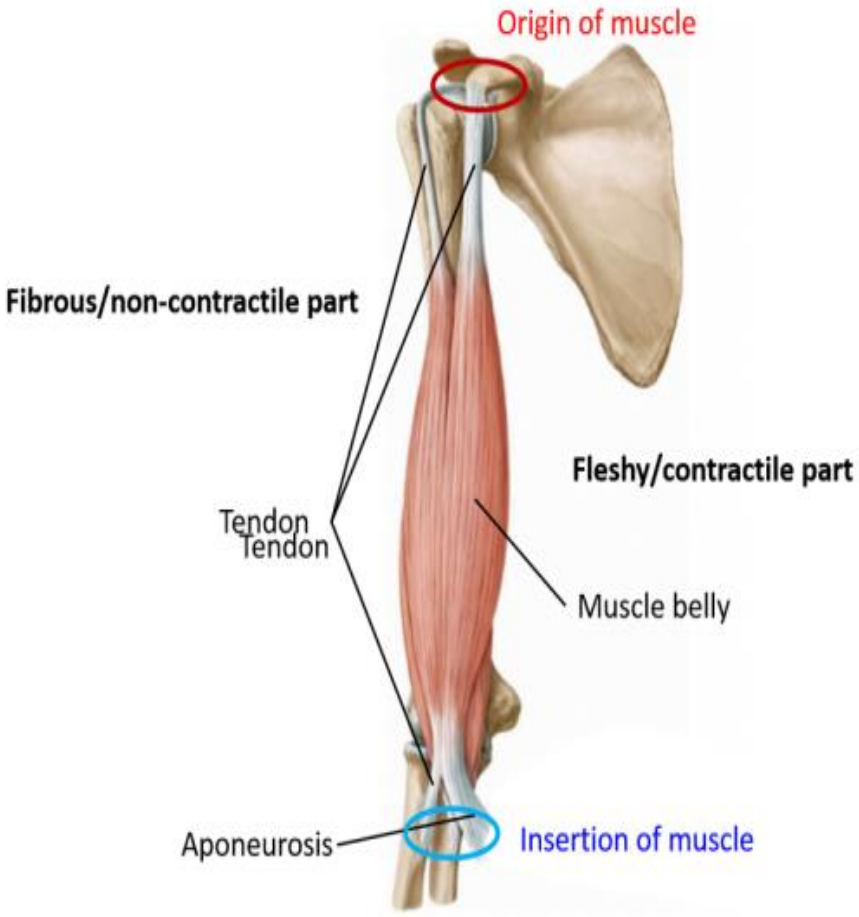

www.visiblebody.com

Skeletal muscles

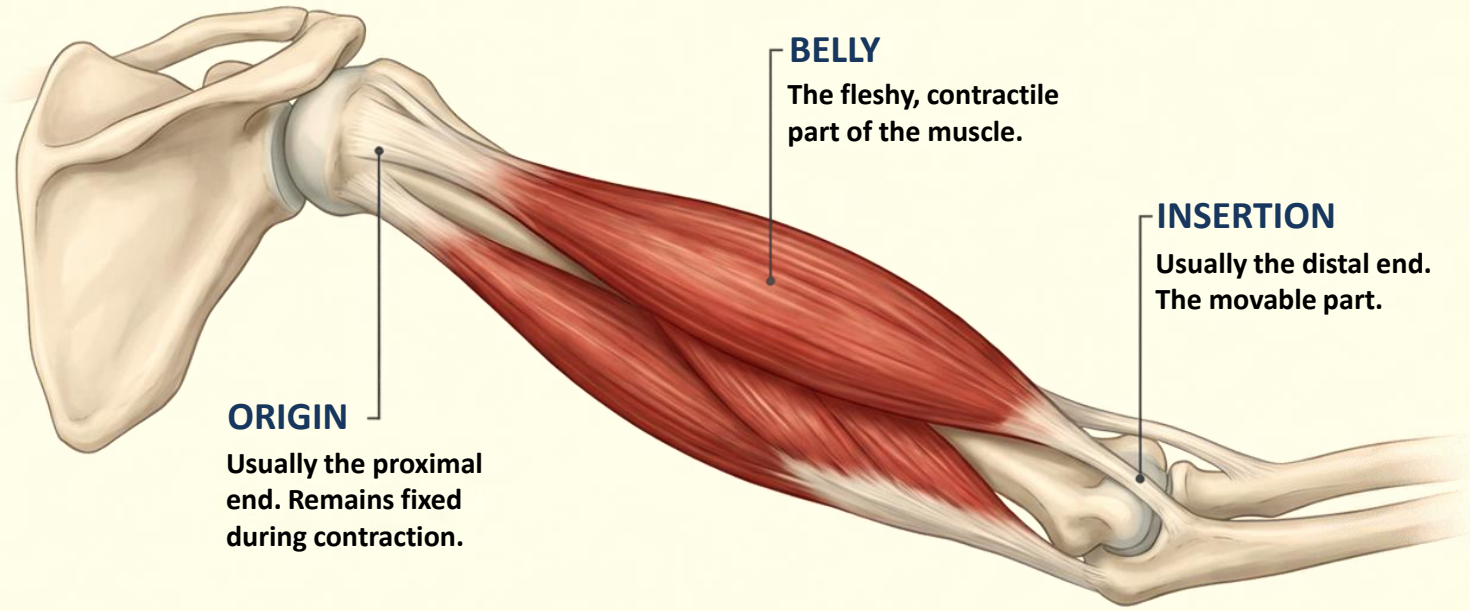

- ✓ The most abundant muscle type in the body.

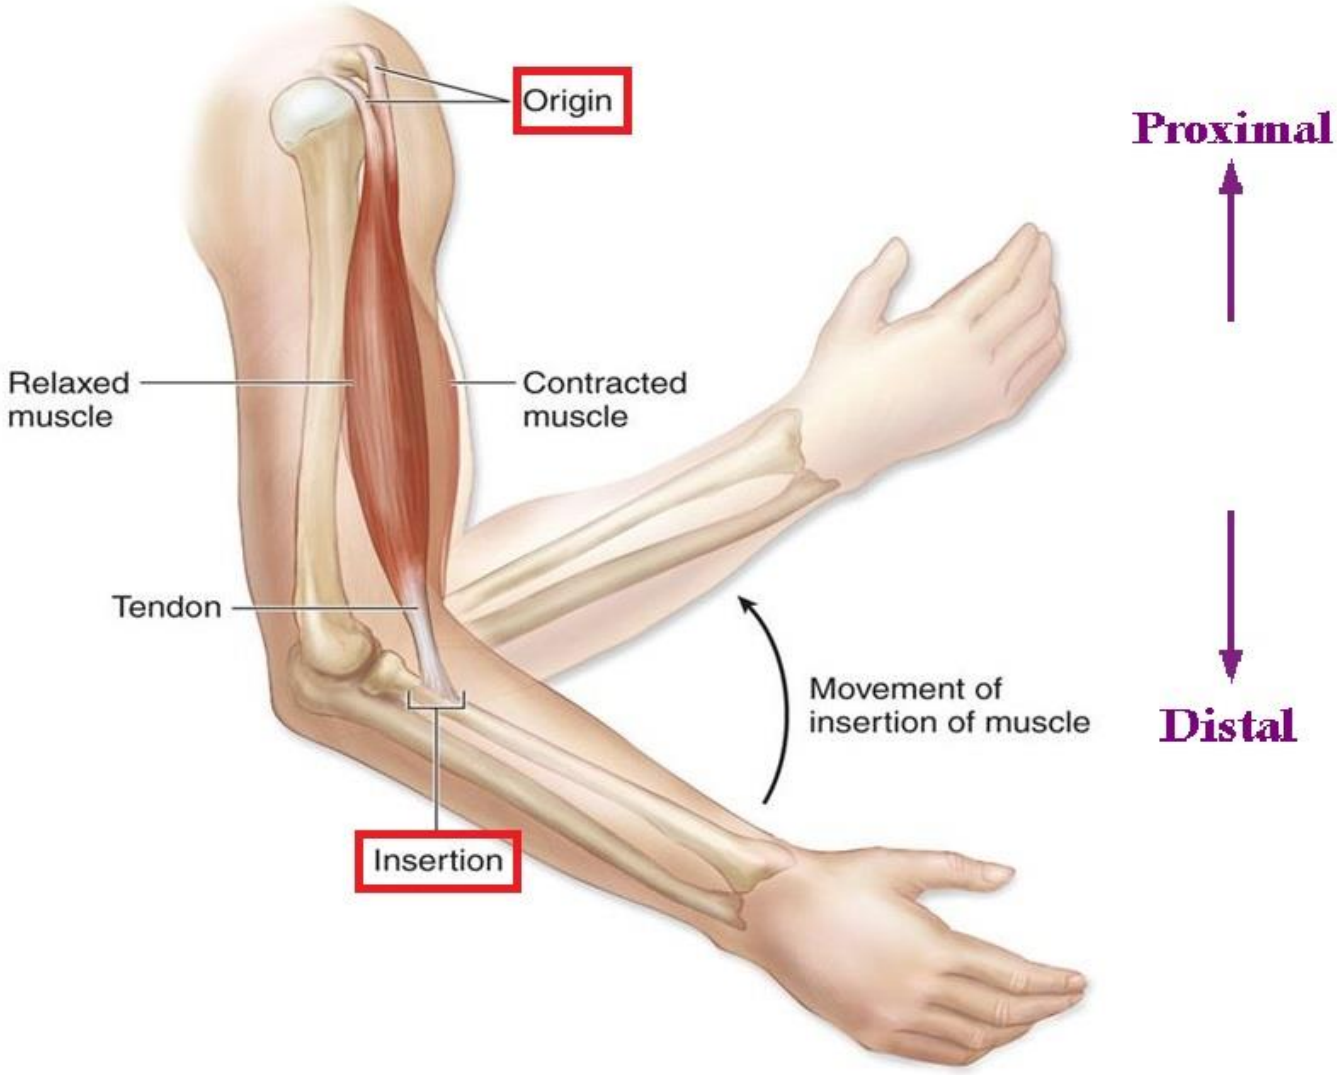

Parts of the muscle:

- ✓ **Origin:** usually the proximal end of the muscle, which remains fixed during muscular contraction.
- ✓ **Insertion:** is usually the distal end of the muscle, which is movable.
- ✓ **Belly:** the fleshy contractile part of the muscle.

Parts of the skeletal muscle

Origin
Proximal
Relaxed muscle
Contracted muscle
Tendon
Movement of insertion of muscle
Distal
Insertion
